**RE: HIGH TRANSOMS/TRANSOM ANGLES**

Surface Drive engines are built in low transom models (16") and high transom models (20".) They will not interchange. Transoms 18" and above should use high transom models. Some boats are built with excessive transom angle (more than 17 degrees.) If so, a different trim bracket that will accommodate the excessive transom angle is available. Examples of these boats are War Eagle, Weld Craft, All Weld, Express, Weld Built and most boats built in Arkansas. The surface drive engine will not trim high enough on these type boats without this modification.

We now build one EZ-Trim lever that works on 17 an 20 degree transoms.
